VoltLync Roadmap H2 2026

VoltLync — What We're Building (Second Half of 2026)

A plain-language summary of our delivery plan, for planning and stakeholder conversations. Companion to the detailed engineering roadmap. Last updated: 2 July 2026.

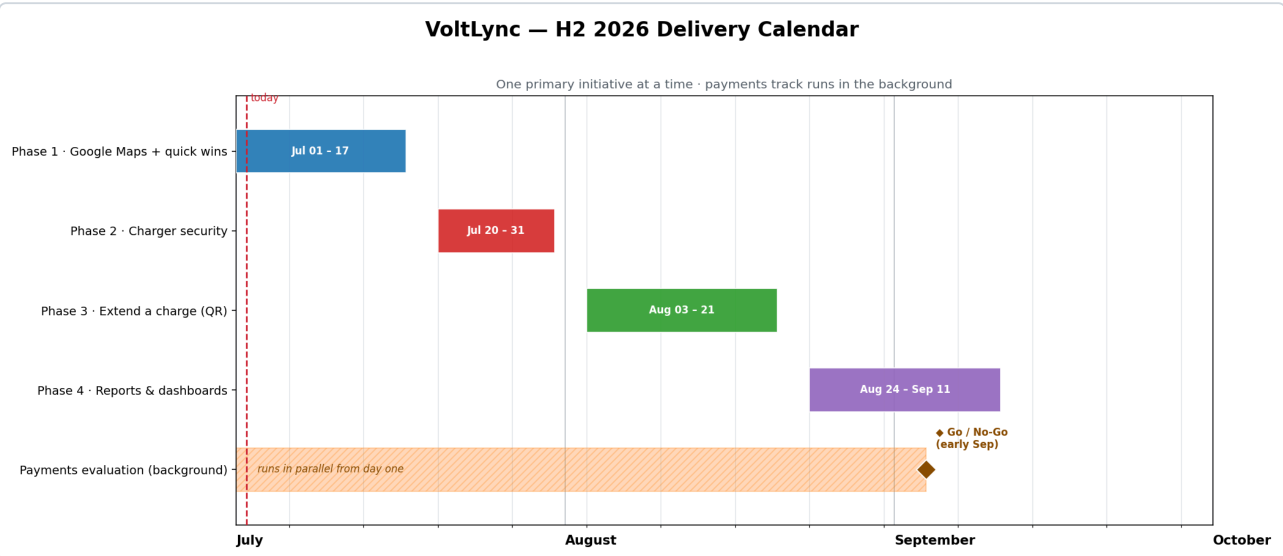
The short version

Over the coming months we'll do five things, roughly in this order:

1. **Get our chargers onto Google Maps** so drivers can find them.
2. **Lock down charger security** to protect billing and prevent tampering.
3. **Let customers top up a charge in progress** instead of getting refunded and re-starting.
4. **Give admins and franchisees proper reports and dashboards.**
5. **In the background, investigate a new payments provider** — only if it clearly beats what we have today.

We work on **one main thing at a time** so quality stays high, while slower, externally-dependent items (like the payments talks) run quietly in the background from day one.

Timeline at a glance



Build work runs July through mid-September; the payments track runs in the background the whole time, with a go/no-go decision in early September. Dates are indicative windows, not fixed deadlines.

When	Focus
Early–mid July	Google Maps visibility + two quick franchisee improvements
Late July	Charger security hardening
Early–mid August	Let customers extend a charge ("top up")
Late August	Reports & dashboards for admins and franchisees
Across the whole period	Payments provider evaluation (decision by early September)

Each item is built in small, self-contained pieces, so if priorities shift we can absorb the change without stalling everything else.

What each item delivers

1. Get on Google Maps *(early–mid July · in progress now)*

Publish our charging network to Google Maps, including live availability (which chargers are free right now). **Why it matters:** drivers can discover our sites → more footfall and revenue for franchisees. **Goal:** first charger visible on Google Maps, tested safely before going fully live.

Two quick wins riding along:

- **Cleaner franchisee view** — show franchisees the numbers that matter to them (their payout and energy delivered) instead of internal platform figures.
- **Smoother sign-in for staff** — staff who land on the public customer page get a clear path back to their own dashboard.

2. Charger security hardening *(late July · high priority)*

Today, anyone who knows a charger's ID could potentially impersonate it — faking sessions, disrupting billing, or knocking a real charger offline. We're closing that gap so every charger must prove it's genuinely itself. **Why it matters:** protects revenue and billing accuracy, and prevents disruption to live chargers. **Note:** this is protection, not a new feature. If we judge the risk urgent, we can move it ahead of the Google Maps work.

3. Let customers extend a charge *(early–mid August)*

Right now, if a customer wants more charge than they initially paid for, the system rejects the extra payment and refunds them — a frustrating dead end. We'll let them simply **pay again to**

keep charging, with no interruption, and automatically refund anything unused. **Why it matters:** removes a real drop-off point and sells more energy.

4. Reports & dashboards *(late August)*

- **For admins:** a new **Reports** area, starting with charger **temperature trends** over time (with high/low/average and downloadable data), and set up to add energy, signal, and revenue reports later.
- **For franchisees:** dashboard graphs showing payouts over time, energy delivered, and settled-vs-pending amounts.

Why it matters: historical insight for fleet health and franchisee self-service — fewer support requests. **Why grouped together:** the admin and franchisee reports share the same underlying engine, so building them side by side is efficient.

5. Payments provider evaluation *(background · decision by early September)*

The problem: our current provider (Razorpay) sometimes quietly slows down "instant" refunds, which hurts the customer experience. We're evaluating an alternative (Paytm).

This is an investigation, not a commitment. We spend money only as long as each checkpoint passes:

- **First and most important:** measure whether the alternative actually gives customers faster, more reliable refunds. If it doesn't clearly win, **we stop here** and instead push our current provider to do better.
- **If it passes:** check whether the alternative can support our franchisee-payout model (requires their team and compliance sign-off).
- **Then:** a formal **go / no-go decision.**

Honest read: early research suggests the alternative may be no better on refunds. That's exactly why we test it cheaply before committing — and if it doesn't win, the recommendation is to *not* migrate.

If we do proceed, the migration itself is a large, separate effort — the biggest cost being re-onboarding every franchisee onto the new system. We'd scope that only after the go decision.

Things to keep an eye on

Item	The risk	How we're handling it
Payments talks	Depend on the other company's team and compliance	Started early, run in parallel — never block other work

Item	The risk	How we're handling it
Payments benefit	The alternative may show no real improvement	Cheap test first; easy to walk away
Charger security rollout	Existing chargers need new credentials	Rolled out gradually — no "big bang" outage
Google Maps listing	Once published, our map identity is permanent	Tested on a safe environment before going live

How we've chosen to sequence things

- **Finish what's already started** (Google Maps) before opening new fronts.
- **Start slow, externally-dependent clocks early** (payments talks) so they're never the bottleneck.
- **Security can jump the queue** if we judge the risk urgent.
- **Build in small, demoable pieces** so progress is visible and priorities can flex.
- **Group work that shares foundations** (the two reporting efforts) to avoid duplicated effort.
- **Cap spending on uncertain bets** (payments) — stop at the first failed checkpoint.

This is a rolling plan and a set of priorities, not a list of fixed deadlines. Sizes and dates are best estimates and will flex as we learn.
